

## Hints:

- 1) Training code has been run and the final model has been trained and saved in 'model.pkl'. the files for training are exactly 1 second length words which have been made by the code 'creating 1 sec length files'. I will upload the non 1 second files (because of the amount of data) to change them to 1 sec files, run that file just consider the train\_audio\_path variable which and correct it according to your PC.
- 2) In order to test the file there is 2 choices, 1: test it with validation data which has been used for training, 2: test a new audio file from your own pc. Only consider it must be less than 1 sec '.wav' file.
